

HAWLE Valves and Hydrants

Reliability and Sustainability from Austria

WATER is the most important element of nutrition. It is the basis for well-being, safety and our health. Through water pipelines buried deep down in the earth the precious liquid is transported from the spring to the consumer. Day by day we rely on the functional safety of the products used so we can step in quickly and reliably in case of emergency such as fire or pipe burst.

In such a sensitive area it is a matter of course to focus attention on the **quality**, **durability** and **operational reliability** of the products.

E. Hawle Armaturenwerke, an Upper Austrian family-owned enterprise based in Vöcklabruck, develops and produces high-quality valves for the water industries. Durability is ensured by maximum possible production control and 100% quality and function testing of the products. This is confirmed by Hawle's unique 10 years' quality warranty. A close cooperation with the customers is the basis for the creation of sustainable innovations such as the resilient seated shut-off valve, design hydrants for harmonious townscapes, or the ZAK system for short installation times while featuring one hundred percent corrosion protection. For more than 60 years all these elements have determined the valve industry.

To ensure quick access to the entire product range in case of need, Hawle not only maintains a comprehensive dealer network, but also a large logistics centre. Competent employees take care of the individual wishes of the customers - from advisory service to delivery to the construction site.

In more than 60 countries worldwide, water distribution companies rely on valves made by Hawle, the technological leader.
